

# Peaked-spectrum sources at low frequencies

ASTRON

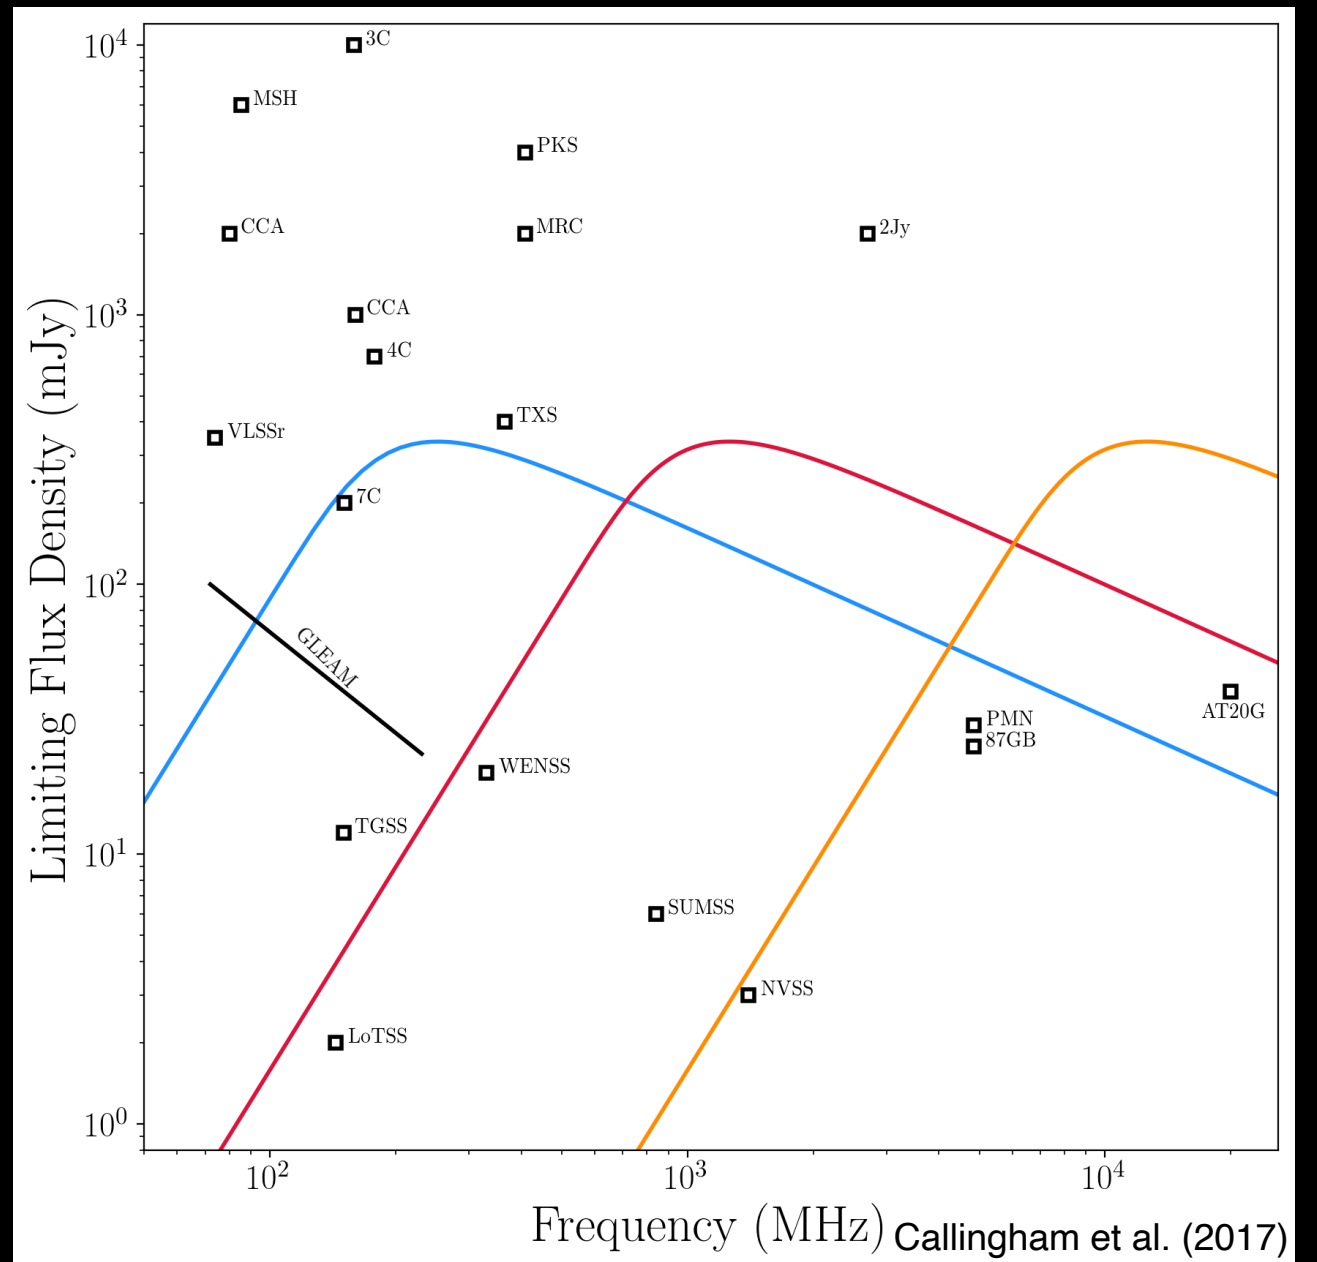

**Joseph Callingham**

Veni Fellow, Leiden University

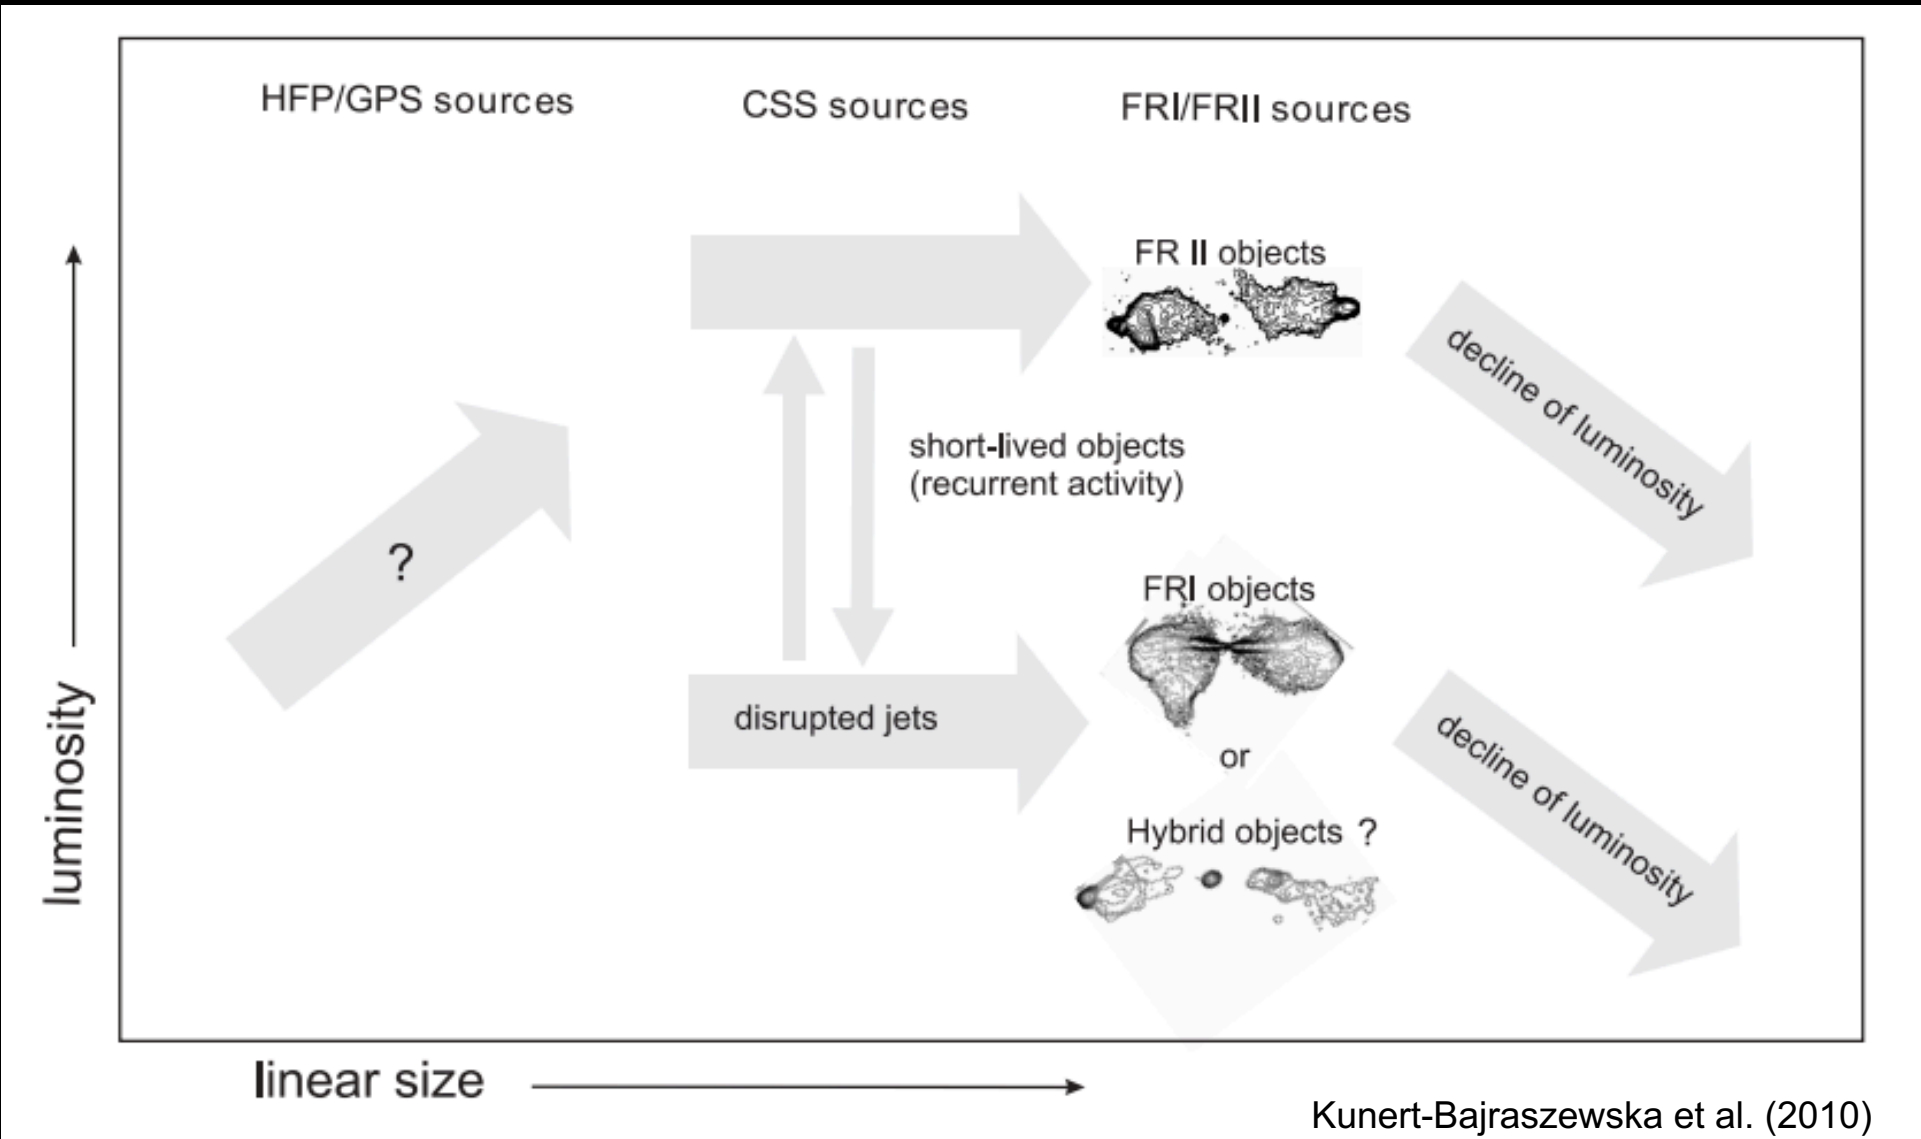

Peaked-spectrum conference, Poland – 11<sup>th</sup> of May 2021

# Why low-frequencies?

- > Often cover large-fractional bandwidth – allowing selecting peaked-spectrum sources without reference to multiple surveys
- > Based on the evolutionary peaked-spectrum picture, probes the largest nearby galaxies and the youngest high-z galaxies
- > Challenges: lower resolution, lower sensitivity (usually), flux density scale issues

# Why low-frequencies?

# Some questions about PS sources at low-frequencies

- > How do the sources relate to canonical GPS and CSS sources?
- > How many are core-jet and how many show double-structure? Should they all be lobe-dominated?
- > As a population, are there more or less PS sources than at gigahertz-frequencies? What does this tell us about evolution?

# What low-frequency telescopes are operating?

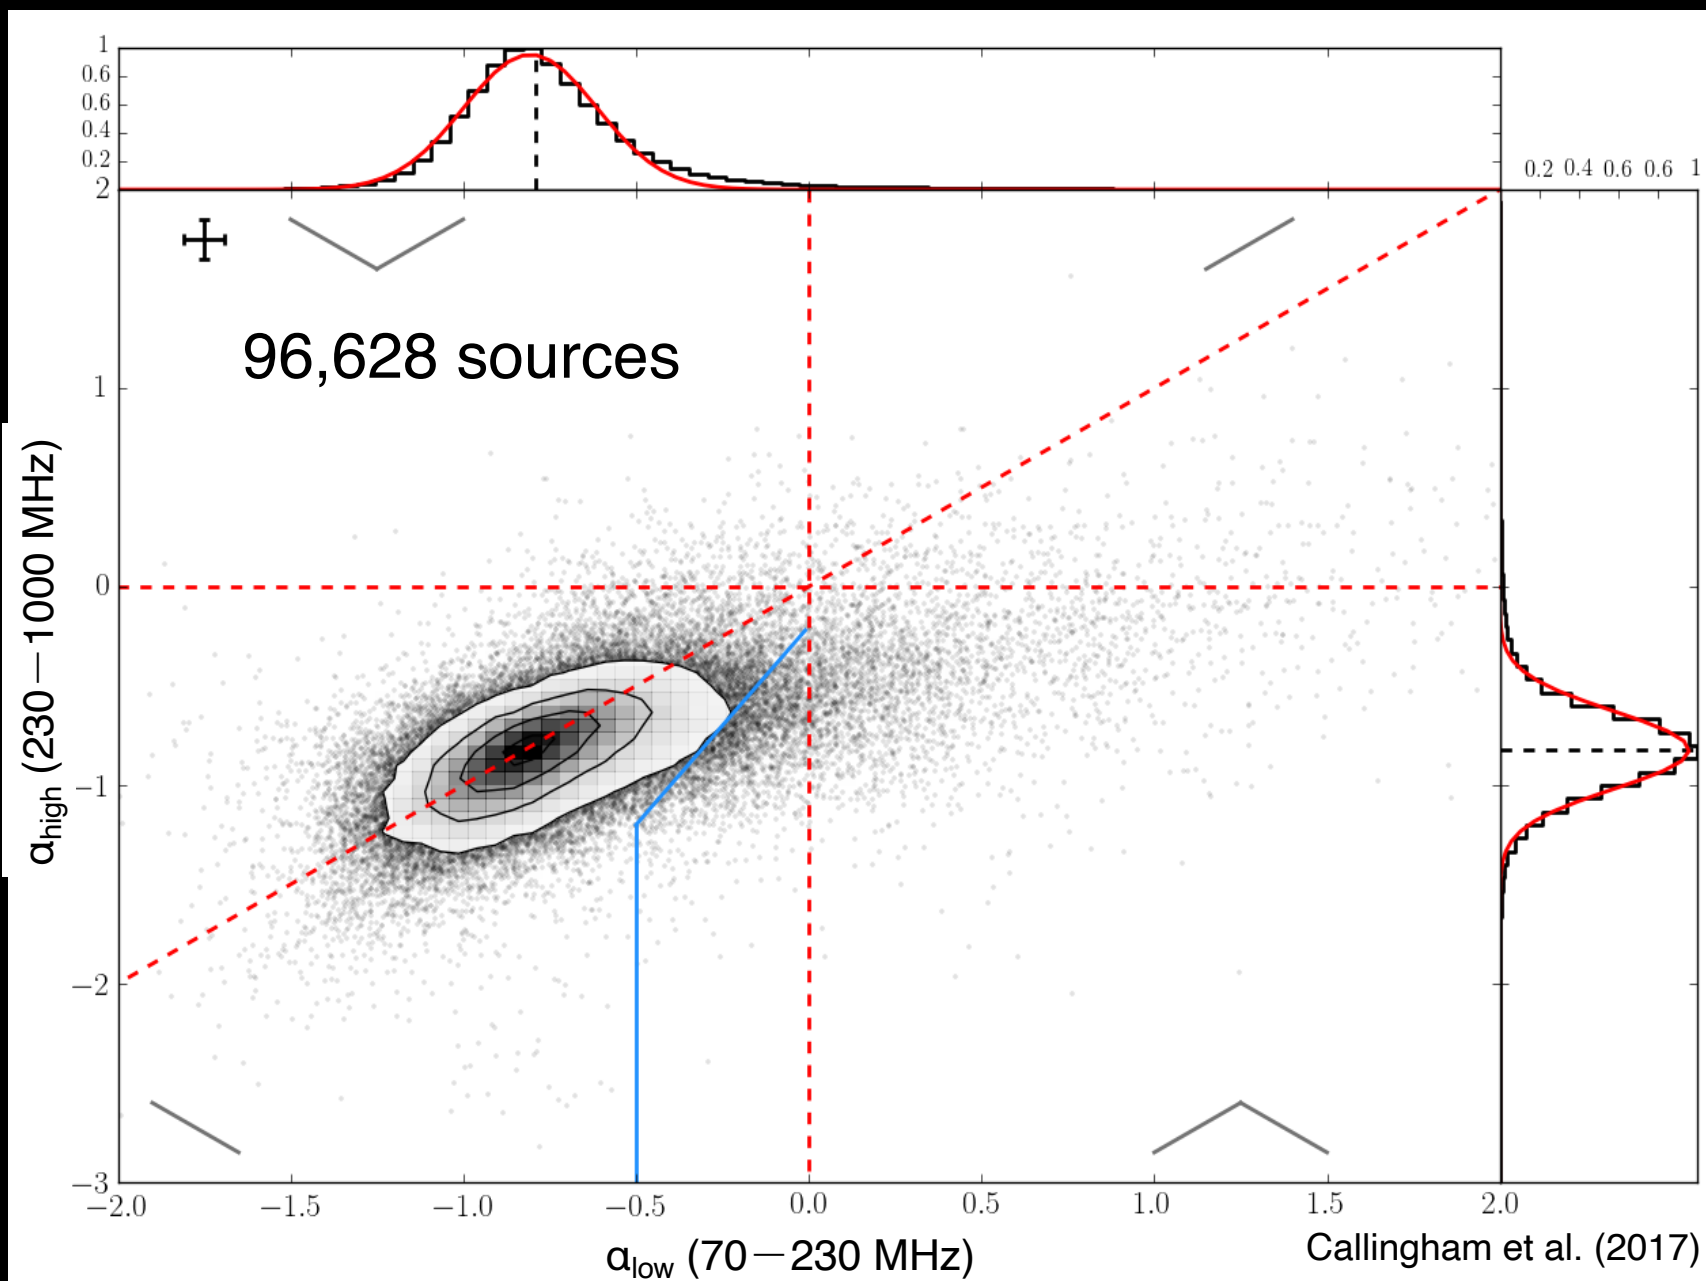

# The SED Revolution with GLEAM

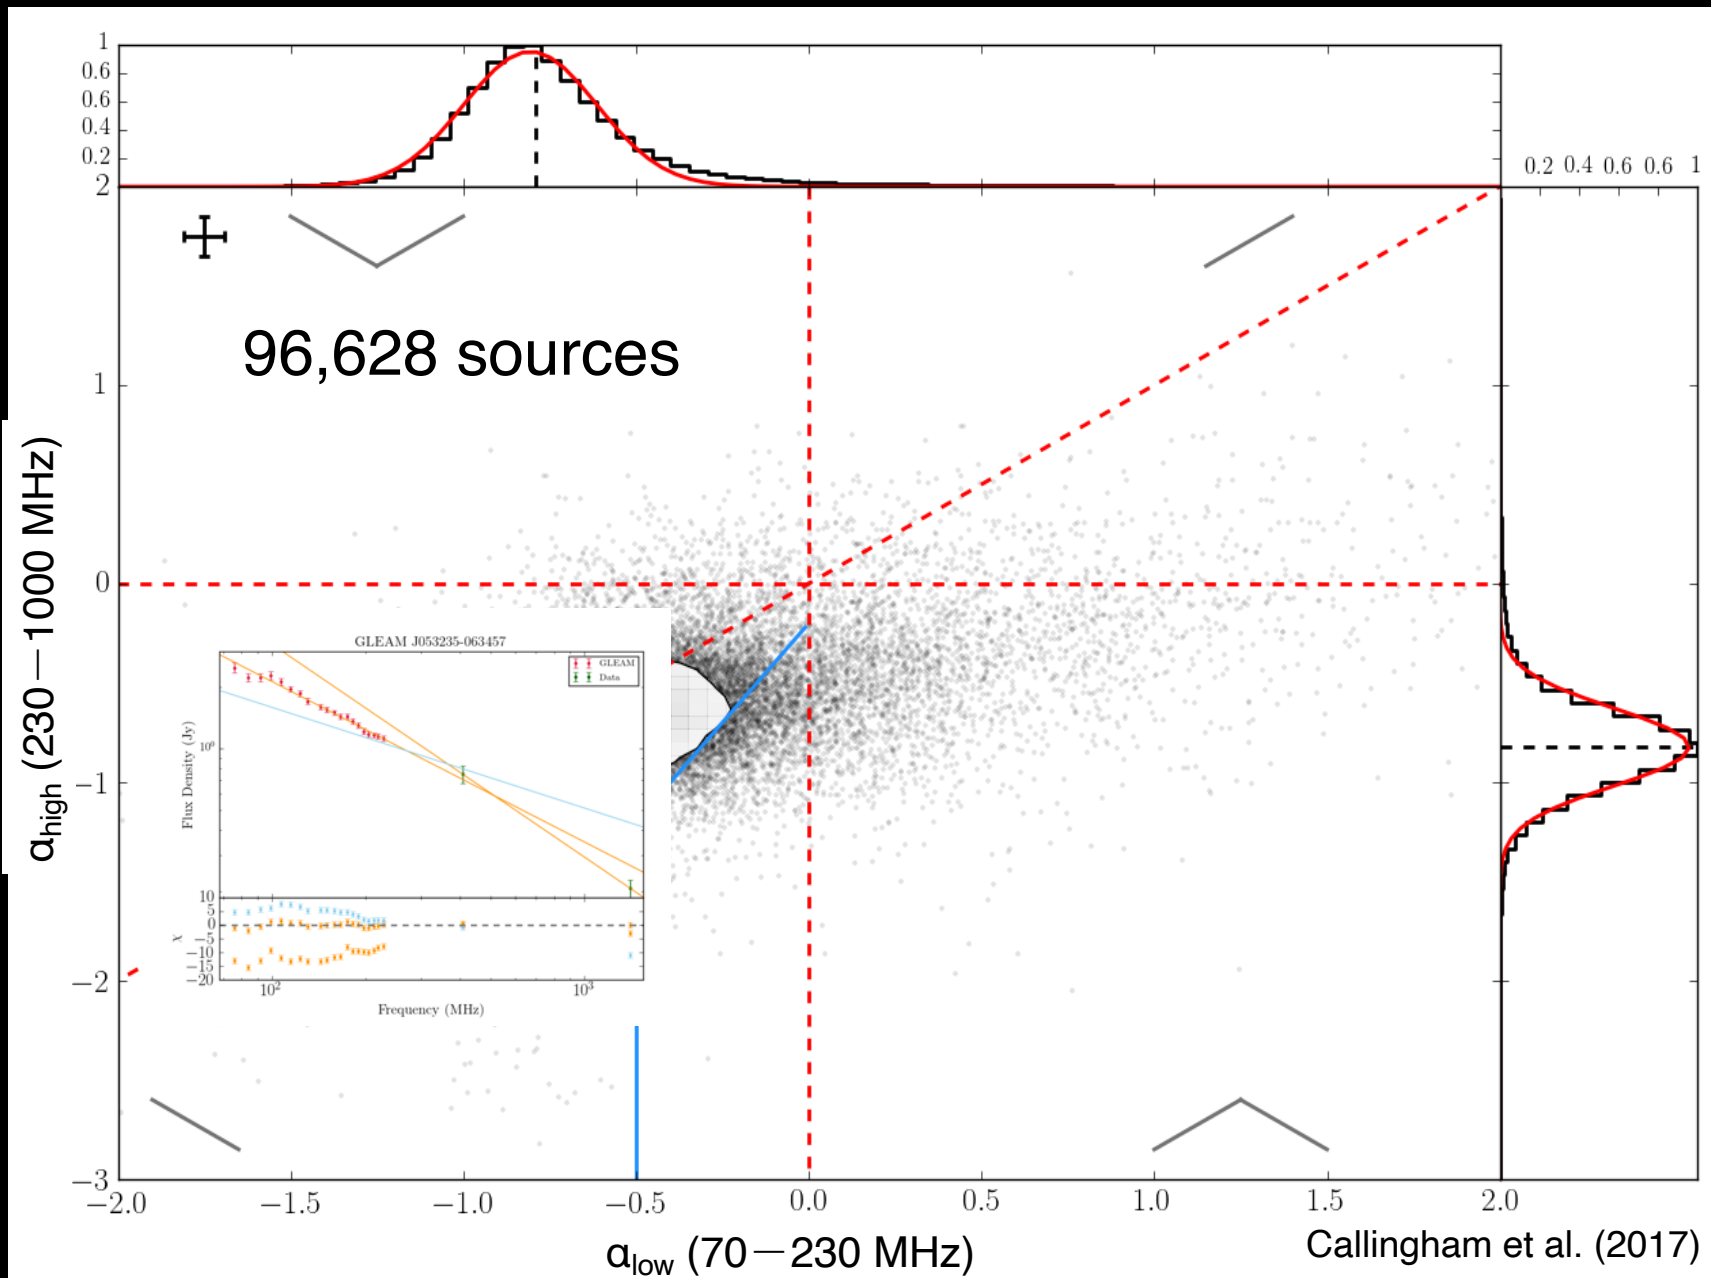

- › MWA GLEAM survey (Hurley-Walker, Callingham et al. 2017)
  - 305,615 sources over 59% of the sky at 2' resolution,  $\sigma \sim 10$  mJy
  - every source: 20 fluxes spanning 72–231 MHz

# Source Counts – too many?

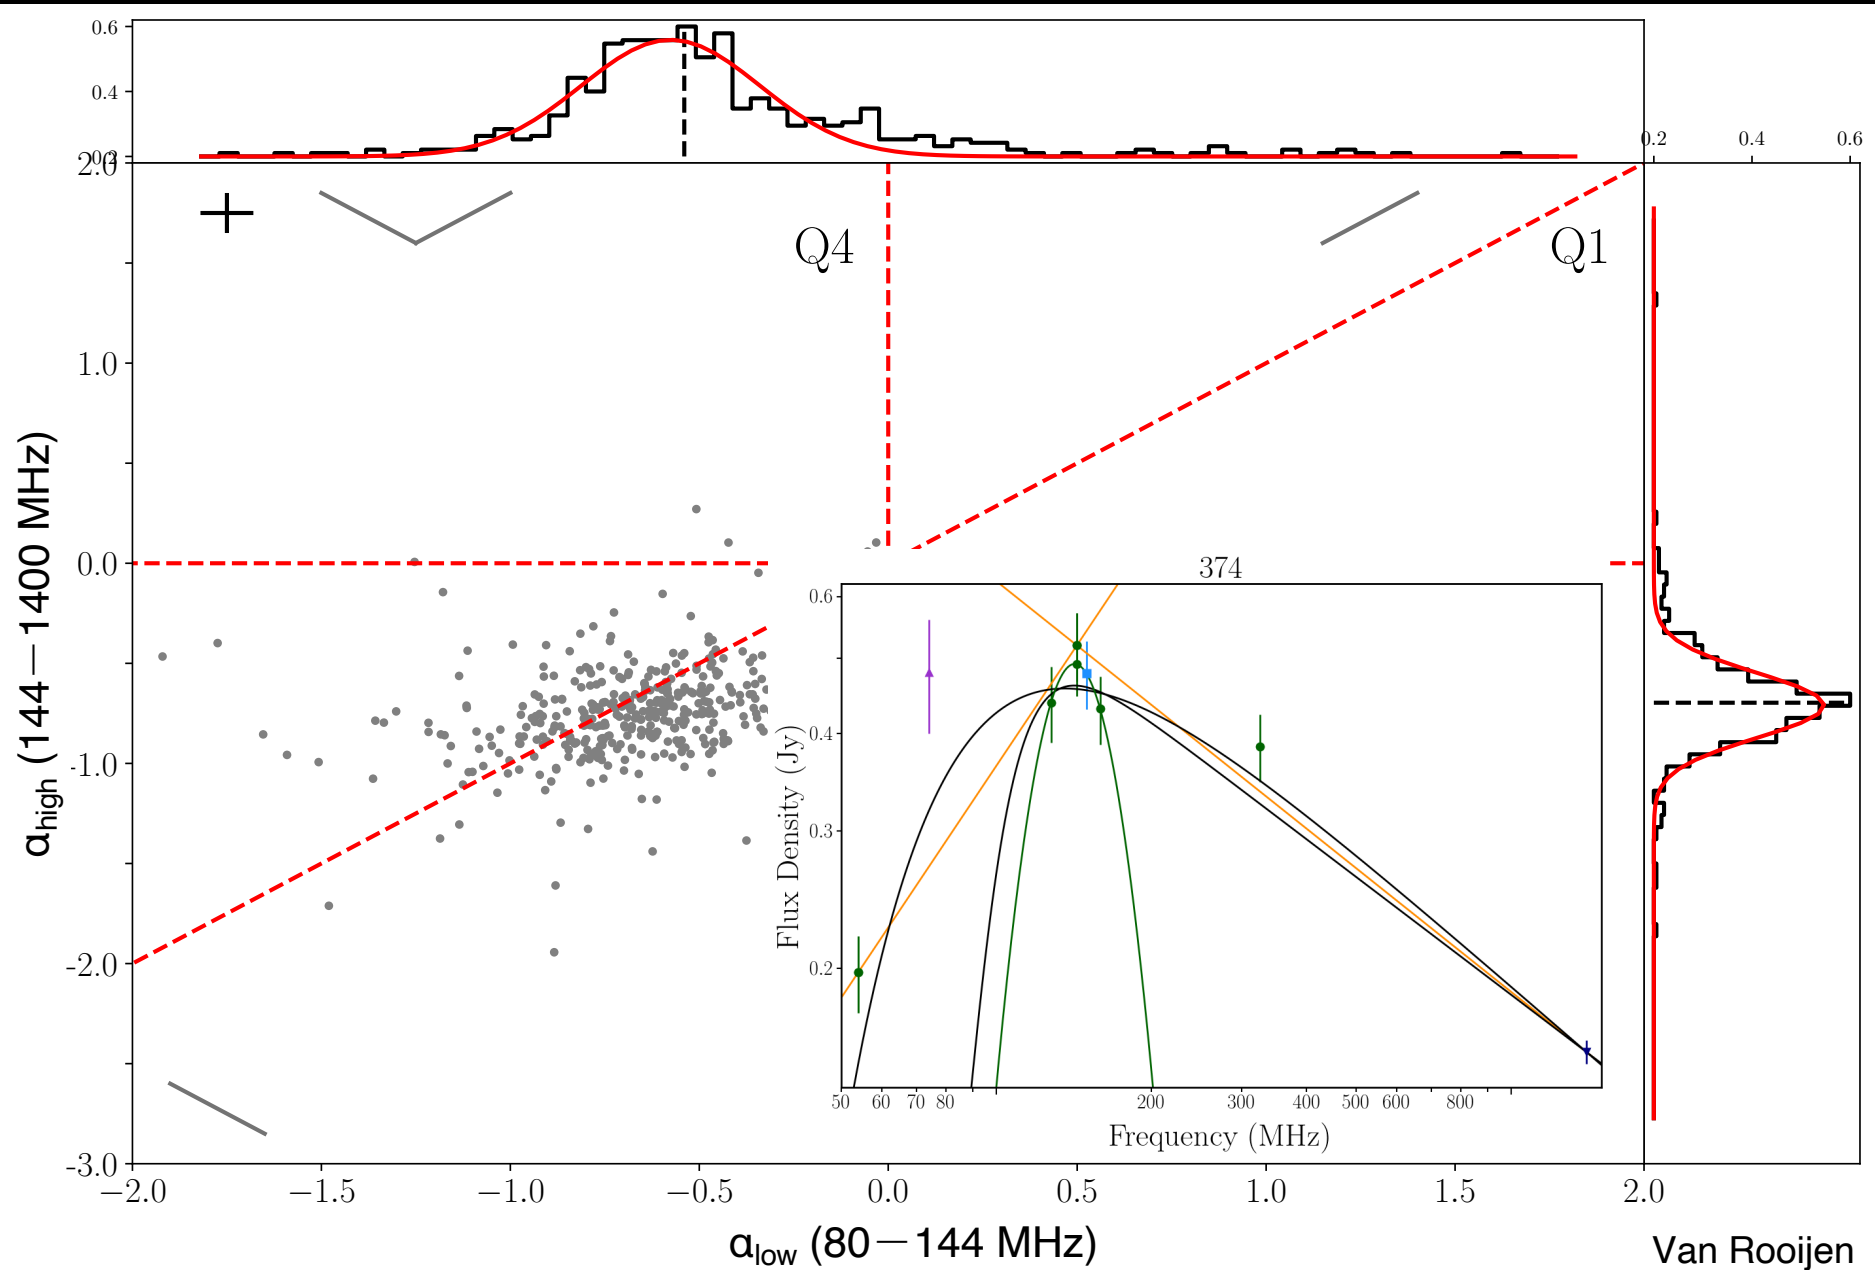

# LoTSS and LoLSS

# Which peaked-spectrum source?

# Which peaked-spectrum source?

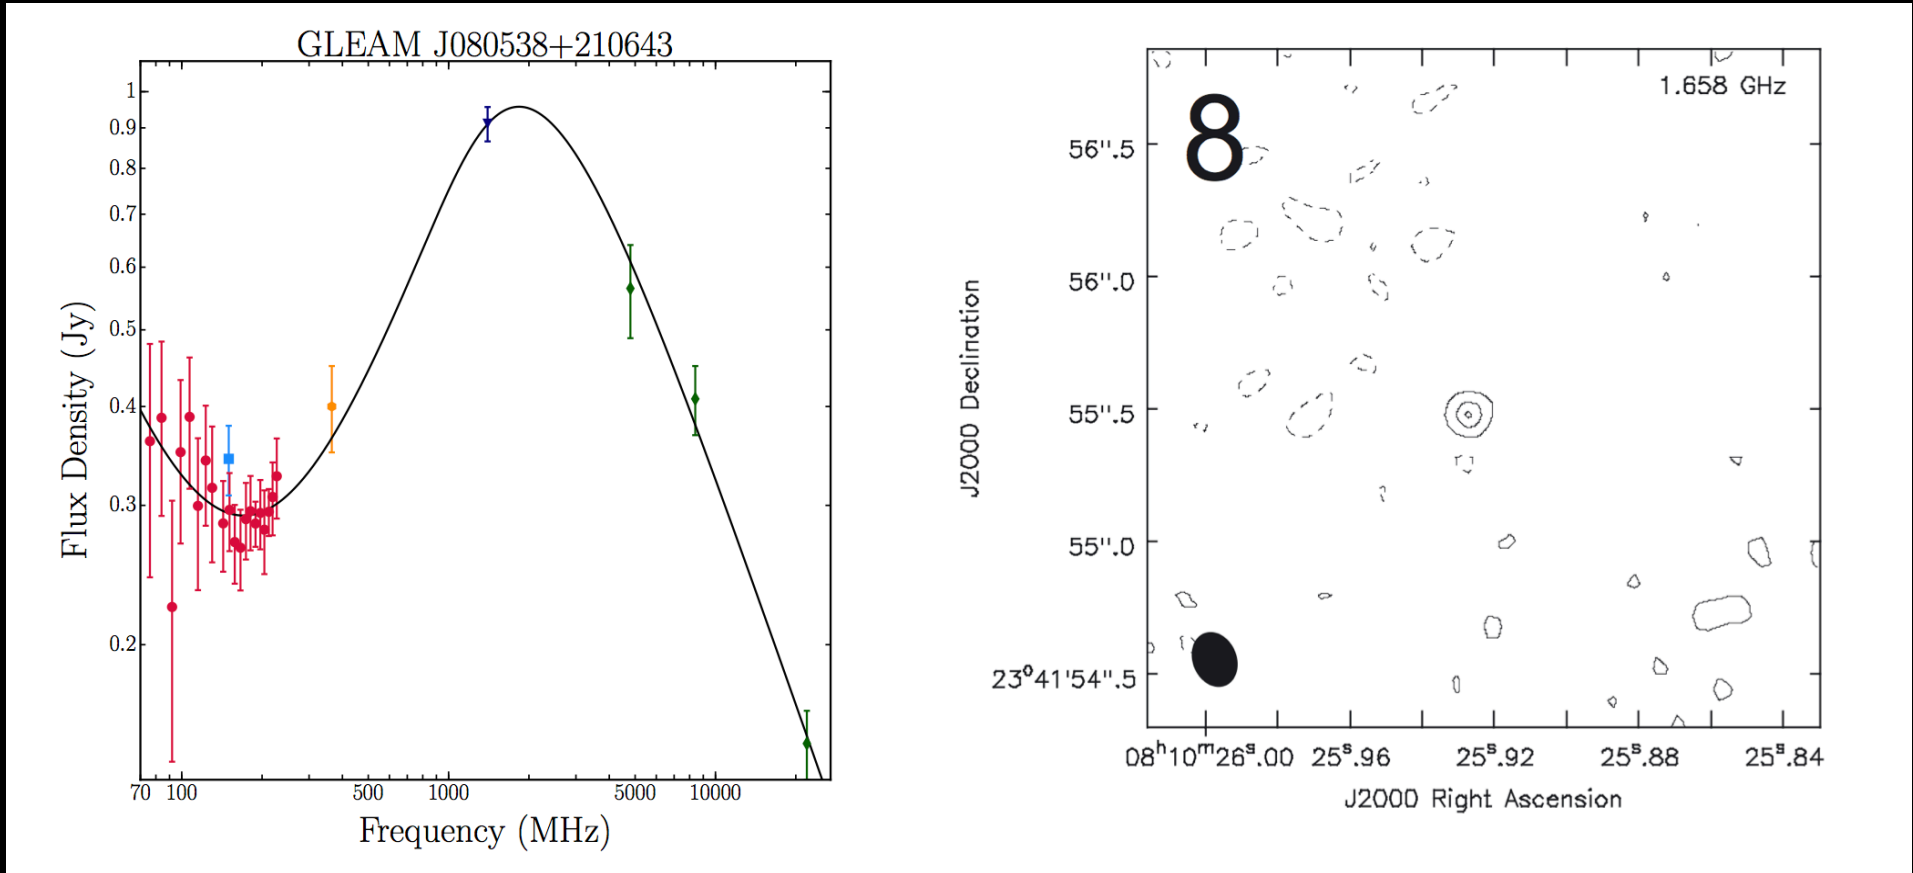

# Too many...

- > ~10 % of sources that have NVSS counterpart are peaked-spectrum
- > Obviously completeness issues but compared to complete sample with GLEAM, we have double the number of sources selected at the same frequency (~4.5%). Why?

# Resolution power of LOFAR

Declination (J2000)

Flux (Jy/beam)

Right Ascension (J2000)

# Conclusions

- › Low-frequencies provided a unique way to sample PS sources (with its own advantages and disadvantages – and only will grow in importance with e.g. SKA)
- › These sources are likely low luminosity counterparts to GPS sources identified at higher freq.
- › Maybe dominant precursors to FR1 galaxies?
- › Finding discrepancy in the number of GPS/CSS sources selected with LoTSS with those selected by GLEAM. Variability bias? Evolution?
- › Using the spectra is a very useful way to find restarted GPS/CSS sources? Duty cycle?
